## Scheduling

Module 12
July 23, 2014

## Outline

## ■ Scheduling

$\checkmark$ What is it?
$\checkmark$ Objectives
Sequencing rules

- Single resource

■ Two resources
$\checkmark$ Employee scheduling

## Scheduling

$\checkmark$ Deals with the timing of operations
$\checkmark$ Specifies when resources are needed to produce a product or provide a service
$\checkmark$ Helps us decide what order to perform jobs
$\checkmark$ All organizations perform scheduling to some extent...

## In service organizations, managers schedule...

Operating room use

Classroom use

Instructor schedules

## In manufacturing organizations, managers schedule...

## Workers

Purchases of materials
Easier to schedule here
Production of goods

Harder to schedule here

## Sequencing Rules

$\checkmark$ Determine the order jobs are processed by a resource
$\checkmark$ Which job should a machine do first, next, etc.?
$\checkmark$ Which surgeries should go to the operating room first?
$\checkmark$ What order should you work on your course projects in?
$\checkmark$ Many sequencing rules exist
$\checkmark$ Each attempts to achieve to an objective

## Objectives in Scheduling

$\checkmark$ Meet customer due dates
$\checkmark$ Minimize job lateness
$\checkmark$ Minimize response time
$\checkmark$ Minimize completion time
$\checkmark$ Minimize time in the system
$\checkmark$ Minimize overtime
$\checkmark$ Maximize machine or labor utilization
$\checkmark$ Minimize idle time
$\checkmark$ Minimize work-in-process inventory

## Types of Sequencing Rules

## Sequencing jobs at a single resource

■ Sequencing jobs across multiple resources

## Sequencing Rules (Single Resource)

■ Local - consider only current work center operation
$\checkmark$ First Come First Served
$\checkmark$ Last Come First Served
$\checkmark$ Shortest Processing Time
$\checkmark$ Longest Processing Time
$\checkmark$ Earliest Due Date

- consider current and all subsequent work center operations needed to complete job
$\checkmark$ Slack Per Remaining Operation
$\checkmark$ Critical Ratio

## Sequencing Rules (Single Resource)

Local
$\checkmark$ First Come First Served
$\checkmark$ Last Come First Served
$\checkmark$ Shortest Processing Time
$\checkmark$ Longest Processing Time Earliest Due Date

■ Global
$\checkmark$ Slack Per Remaining Operation
$\checkmark$ Critical Ratio

## Sequencing Example

This semester you took 5 classes
Each has a major project due at some point in the semester

Projects are assigned during the first week of the semester

## Sequencing Example

This semester you took 5 classes
Each has a major project due at some point in the semester

Projects are assigned during the first week of the semester

## First Come First Served (FCFS)

Jobs are processed in order of arrival Which comes first?

## First Come First Served (FCFS)

| Management |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Global Rules

- Consider more than current operation

■ Look at work at other work centers that needs to be completed before the job is done

## Types of Sequencing Rules

- Sequencing jobs at a single resource

Sequencing jobs across multiple resources

## Scheduling Across Multiple Resources

■ Previous rules considered scheduling (sequencing) jobs at one resource

- How can we schedule jobs across multiple resources??

## Two resource problems

Suppose you work with a classmate, Kim on all projects
In each project you do the research, then Kim writes the report
You want to complete all projects asap

Processing time (you): $2 \quad 6 \quad 3 \quad 5 \quad 1$

Processing time (Kim): $\begin{array}{llllll}4 & 3 & 5 & 4 & 2\end{array}$

What should be the order for the projects?

## Two resource problems

Johnson's Rule Sequences tasks to minimize makespan

1. Find the smallest processing time

- If its on the 1st machine, assign the task at the beginning of the sequence and eliminate it from further consideration
- If its on the $2 n d$ machine, assign the task at the end of the sequence and eliminate it from further consideration

2. Repeat step 1 for all unassigned tasks

Processing time (you): $2 \quad 6 \quad 3 \quad 5 \quad 1$

Processing time (Kim): $\begin{array}{llllll}4 & 3 & 5 & 4 & 2\end{array}$

What order should you do the projects in?

## Two resource problems

## Employee Scheduling

$\checkmark$ Labor is very flexible resource
$\checkmark$ Scheduling workforce is complicated repetitive task
$\checkmark$ Heuristics commonly used

We'll cover one simple one today...

## Employee Scheduling Heuristic

Let $N=$ no. of workers available
$D_{i}=$ demand for workers on day $i$

1. Assign the first $N-D_{1}$ workers day 1 off. Assign the next $N$ - $D_{2}$ workers day 2 off. Continue in a similar manner until all days are scheduled.
2. If number of workdays for full time employee < 5, assign remaining workdays so consecutive days off are possible.

- Assign any remaining work to part-time employees.

3. If consecutive days off are desired, consider switching schedules among days with the same demand requirements.

## Example

| DAY OF WEEK | M | T | W | TH | F | SA | SU |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| MIN NO. OF |  |  |  |  |  |  |  |
| WORKERS REQUIRED | 3 | 3 | 4 | 3 | 4 | 5 | 3 |

Taylor
Smith
Simpson
Allen
Dickerson
$\mathrm{O}=$ day off

1. Assign the first $\mathbf{N}-\mathrm{D} 1$ workers day 1 off. Assign the next N-D2 workers day 2 off. Continue in a similar manner until alldays are have been scheduled.

## $\begin{array}{llllllll}\text { DAY OF WEEK } & \text { M } & \text { T } & \text { W TH } & \text { F } & \text { SA } & \text { SU }\end{array}$

MIN NO. OF
WORKERS REQUIRED $D_{1}=3 \quad D_{2}=3 \quad D_{3}=4 \quad D_{4}=3 \quad D_{5}=4 \quad D_{6}=5 \quad D_{7}=3$
$\mathbf{N}=5\left\{\begin{array}{l}\text { Taylor } \\ \text { Smith } \\ \text { Simpson } \\ \text { Allen } \\ \text { Dickerson }\end{array}\right.$

$$
N-D_{1}=5-3=2
$$

1. Assign the first $\mathbf{N - D 1}$ workers day 1 off. Assign the next N-D2 workers day 2 off. Continue in a similar manner until all days are have beenscheduled.

| DAY OF WEEK | M | T | W | TH | F | SA | SU |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| MIN NO. OF |  |  |  |  |  |  |  |
| WORKERS REQUIRED | 3 | 3 | 4 | 3 | 4 | 5 | 3 |
| Taylor | 0 |  |  |  |  |  |  |
| Smith | 0 |  |  |  |  |  |  |
| Simpson |  |  |  |  |  |  |  |
| Allen |  |  |  |  |  |  |  |
| Dickerson |  |  |  |  |  |  |  |

$$
\mathrm{N}-\mathrm{D}_{2}=5-3=2
$$

2. If number of workdays for full time employee < 5, assign remaining workdays so consecutive days off are possible.

| DAY OF WEEK | M | T | w | TH | F | SA | SU | Work days |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| MIN NO. OF WORKERS REQUIRED | 3 | 3 | 4 | 3 | 4 | 5 | 3 |  |
| Taylor | 0 | X | X | 0 | X | X | X | 5 |
| Smith | 0 | X | X | 0 | X | X | X | 5 |
| Simpson | X | 0 | X | X | 0 | X | X | 5 |
| Allen | X | 0 | X | X | X | X | 0 | 5 |
| Dickerson | X | X | 0 | X | X | X | 0 | 5 |

3. If consecutive days off are desired, consider switching schedules among days with the same demand requirements.

| DAY OF WEEK | M | T | W | TH | F | SA | SU |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| MIN NO. OF |  |  |  |  |  |  |  |
| WORKERS REQUIRED | 3 | 3 | 4 | 3 | 4 | 5 | 3 |
| Taylor | O | X | X | O | X | X | X |
| Smith | O | X | X | O | X | X | X |
| Simpson | X | O | X | X | O | X | X |
| Allen | X | O | X | X | X | X | O |
| Dickerson | X | X | O | X | X | X | O |

Completed schedule satisfies requirements but has no consecutive days off.
3. If consecutive days off are desired, consider switching schedules among days with the same demand requirements.

| DAY OF WEEK | M | T | W | TH | F | SA | SU |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| MIN NO. OF |  |  |  |  |  |  |  |
| WORKERS REQUIRED | 3 | 3 | 4 | 3 | 4 | 5 | 3 |
| Taylor | 0 | X | X | 0 | X | X | X |
| Smith | O | X | X | O | X | X | X |
| Simpson | X | O | X | X | O | X | X |
| Allen | X | O | X | X | X | X | 0 |
| Dickerson | X | X | O | X | X | X | 0 |

3. If consecutive days off are desired, consider switching schedules among days with the same demand requirements.

| DAY OF WEEK | M | T | W | TH | F | SA | SU |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| MIN NO. OF |  |  |  |  |  |  |  |
| WORKERS REQUIRED | $\mathbf{3}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ | $\mathbf{3}$ |
| Taylor | O | O | X | X | X | X | X |
| Smith | O | 0 | X | X | X | X | X |
| Simpson | X | X | X | 0 | O | X | X |
| Allen | X | X | X | O | X | X | O |
| Dickerson | X | X | O | X | X | X | O |

The revised schedule satisfies requirements with consecutive days off for most employees.

## Service Management; Queuing (WAITING LINE)

## Overview

■ Nature of services
■ Service system design

- Service queues
$\checkmark$ Components
$\checkmark$ Examples (analysis)

## Nature of Services

- Everyone is an expert
- Idiosyncratic
$\checkmark$ what works for one may not others
- Quality of work is not quality of service

■ Mix of tangible and intangible attributes

- High contact services are "experienced"
- Need to understand marketing \& personnel
- Cycles of encounters

## Service System Design Matrix

Degree of customer/server contact

## Designs for On-Site Service

- Production Line Approach $\checkmark$ McDonald's
- Self-Service Approach
$\checkmark$ Salad bar, ATMs, gas stations
- Personal Attention Approach $\checkmark$ Ruth's Steakhouse

## Disney World

- Waiting in lines does not add enjoyment
- Waiting in lines does not generate revenue
- Waiting lines are Non-Value Adding!

## Implications of Waiting Lines

- 1. Cost and congestion from waiting space
- 2. Loss of immediate business
- 3. Loss of long term goodwill
- 4. Reduction in customer satisfaction

## Queuing (Waiting Line) Systems

- The familiar "waiting in line" situation
- Frustrating, annoying
- Managing well is key
$\checkmark$ Objectives - depend on situation $\checkmark$ Balance service with productivity

## You've Been There Before!

‘The other line always moves faster.
'If you change lines, the one you left will start to move faster than the one you're in.'

Thank you for holding. Hello...are you there?

## Waiting Line Examples

## Optimal <br> Level of service

## Waiting Line Terminology

■ Queue: Waiting line
■ Arrival: 1 person, machine, part, etc. that arrives and demands service
■ Queue discipline: Rules for determining the order that arrivals receive service
■ Channel: Number of waiting lines

- Phase: Number of steps in service

# Multi-Channel, Single Phase System 

## Service system

## Arrivals

Example: Bank customers wait in single line for one of several tellers.

## Multi-Channel, Multi-Phase System

## Service system

## Arrivals

Example: At a laundromat, customers use one of several washers, then one of several dryers.

## Waiting Line Priority Rules

$\square$ 1. First come, first served

- 2. Best customers first (reward loyalty)
- 3. Highest profit customers first
- 4. Quickest service requirements first
- 5. Largest service requirements first
- 6. Earliest reservation first

■ 7. Emergencies first

## Queue Psychology

■ Unoccupied time vs. occupied time
■ Pre-process wait vs. in-process wait

- Uncertain waits vs. certain waits

■ Unexplained waits vs. explained waits

- Unfair waits vs. equitable waits
- Willingness to wait related to value
- Solo waits vs. group waits

## Changing System Performance

- 1. Customer Arrival Rates
$\checkmark$ Ex: Try to smooth demand through non-peak discounts or price promotions
- 2. Number and type of service facilities
$\checkmark$ Ex. Increase or decrease number of servers, or dedicate specific servers for certain tasks (e.g., express line for under 10 items)
- 3. Change Number of Phases

Ex. Can use multi-phase system instead of single phase. This spreads the workload among more servers and may result in better flow (e.g., fast food restaurants having an order phase, pay phase, and pick-up phase during busy hours)

## Changing System Performance

- 4. Server efficiency
$\checkmark$ Ex: Add resources to each phase (e.g., bagger helping a checker at the grocery store)
$\checkmark$ Ex: Use technology (e.g. price scanners) to improve efficiency
- 5. Change priority rules

Ex: implement a reservation protocol
$\square$ Change the number of lines
$\checkmark$ Ex: Reduce multiple lines to single queue to avoid jockeying
$\checkmark$ Ex: Dedicate specific servers to specific transactions

## Summary

■ What is scheduling

- Basic sequencing options
- Johnson's rule
- Nature of Services

■ Waiting Line Terminology

- Changing Service Performance
